

EMU OIL

Nature's Own Healing Oil

Emu Oil comes from a layer of fat of the Emu, a bird native to Australia. It has been used for thousands of years by the Australian aborigines for the treatment of burns, wounds, bruises, and as a pain reliever for bone, muscle, and joint disorders.

Emu Oil is approx. 70% unsaturated fatty acids. The largest component is oleic acid, a mono-unsaturated omega-9 fatty acid which has an anti-inflammatory effect on dermal tissue, an identifiable anti-degenerative effect on skin cells, and a natural absorption to the skin. **Emu Oil** also has approx. 20% linoleic acid, an omega-6 fatty acid, which is known to temporarily ease joint pain. **Emu Oil** also has linolenic acid, an omega-3 fatty acid. **Emu Oil** is almost 100% triglyceride in nature, meaning that it is almost a completely neutral lipid. There is also a lack of phospholipids, which explains **Emu Oil's** high penetrating qualities since the human skin is naturally phospholipids deficient. **Emu oil** acts as a unique transdermal carrier because of its deep penetrating ability.

Despite the fact it is oil, **Emu Oil** has been clinically proven to be a non-pore clogging substance. **Emu Oil** penetrates the skin layers very quickly, leaving no greasy residue. There have been no known allergic reactions from **Emu Oil** in studies.

Emu Oil has been shown in studies to aid in reducing scar formation in burn wounds, surgical incisions and other topical skin abrasions. With its natural anti-inflammatory properties, studies have shown **Emu Oil** to aid in relief of arthritic pain. **Emu Oil** also significantly reduces recent keloid scarring. Studies have also shown that **Emu Oil** will strengthen the skin, give it more elasticity, and reduce unwanted pigmentation.

Emu Oil is used in the treatment of:

Arthritis	Swollen joints	Sore muscles	Scrapes, bruises
Skin Abrasions	Wounds	Surgical incisions	Burns
Sun damage	Aging skin	Eczema	Psoriasis
Shingles	Rosacea	Rashes	Diaper Rash
